Manager of Support Systems  
MySQL, Inc.

# unicode!!!!

- True support for Unicode (UTF-8) in PHP 6
- Can be disabled on per server basis

# caching

- APC (Alternative PHP Cache) moved to the core.
- Written by Rasmus
- Both page level (opcode) and application caching.

# namespaces

- Namespaces are in PHP 6 and 5.3
- “namespace X::Y::Z” means all new class/function/ method names are prefixed with X::Y::Z class/ function/methods are resolved first against X::Y::Z.
- “import X::Y::Z as Foo” aliases the prefix “Foo” to actually mean “X::Y::Z”

# late static binding

- In both 6.0 and 5.3
- See <http://blog.felho.hu/what-is-new-in-php-53-part-2-late-static-binding.html>

```
<?php

class ActiveRecord
{
    public static function findByPk($id)
    {
        $calledClass = get_called_class();
        // The magic happens here
    }
}

class Blog extends ActiveRecord {}

Blog::findByPk(1);
?>
```

# mysqlnd

- MySQL database driver written in the Zend Engine (nd == ‘native driver’)
- faster execution
- lower memory usage
- performance statistics
- client side cache (not ready for 5.3)
- Works with ext/mysql, ext/mysqli, PDO/mysql
- Available in 6.0 and 5.3

# breaking to a label

- similar to “goto”
- Can jump to a labeled point further down the execution path.

```
<?php
for ($i = 0; $i < 9; $i++)
{
    if (true) {
        break blah;
    }
    echo "not shown";
blah:
    echo "iteration $i\n";
}
?>
```

# foreach on multi-dimensional arrays

- syntactic sugar

```
<?php
$a = array(
    array(1, 2),
    array(3, 4)
);
foreach( $a as $k => list($a, $b)) {
    // blah
}
?>
```

# improvements to []

- For both strings and arrays, the [] operator will support substr()/array\_slice() functionality.
- [2,3] is elements (or characters) 2, 3, 4
- [2,] is elements (or characters) 2 to the end
- [,2] is elements (or characters) 0, 1, 2
- [,-2] is from the start until the last two elements in the array/string
- [-3,2] this is the same as substr and array\_slice()
- [,:] doesn't work on the left side of an equation (but does on the right side)

# microtime

- `microtime` returns a full float instead of “`timestamp microtime`”
- Just like calling `microtime(true)`

- calling dynamic functions statically throws  
`E_ERROR`

# removed features

- register globals
- magic quotes
- safe mode
- ereg removed from the core
- long variables (i.e. `$HTTP__*__VARS`)
- <%

# thank you
